

ABSTRACT

[050] The invention is directed to a fastener for multiple locking of doors or wall portions in housings or cabinets, particularly for outdoor use, by means of a lockable actuation member such as a handle lever, comprising a drive toothed wheel which is connected to the actuation member supported in the door so as to be rigid against rotation and which engages with a lock rod which is supported in the door so as to be displaceable axially and which has teeth on at least one side, and with lock elements which are held in the door so as to be rotatable or swivelable and which are coupled with the lock rod. According to the invention, for each lock element, a driven toothed wheel which is connected to the lock elements so as to be rigid against rotation and which engages with the teeth of the lock rod is held on the door in a rotatable manner in order to couple the lock rod with the lock elements.
